

Sign Up **button** website guide

Guide written by Nas
Selling with Nas

If you've built your website with Claude Code and are looking to add a Sign Up / Login functionality so people can access your actual product, you're reading the right guide. Below I share everything you need to be able to add a Database to your site for free.

What will you need?

To Use Claude Code to build a website, you will need 2 things:

1) A Supabase Account

It's super easy to create an account and the FREE tier allows up to 50k users.

2) Google Cloud Console

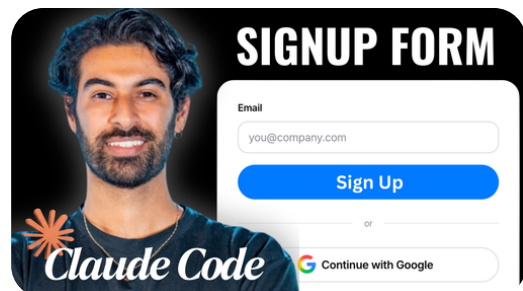

You can access your GCC for free, and it allows you to get the token to enable "Sign in with Google".

Are you a more visual person?

If you want to see a video guide on Youtube of how to add Sign Up button to your site. Here:

<https://youtu.be/LU6tfZImYdQ>

If you want to build your first App with me, you can join my Live session:

[Book your slot for a live session](#)

Step 1) Create a Free Account on Supabase

Go to supabase.com/dashboard → New project. Pick a region near you. Save the database password somewhere - you won't need it for this app, but you'll want it later.

Wait for provisioning to finish (~2 min) before step 3.

nas@talktomedata.com

Step 2) Get your project's API Keys

You can find them in Project Settings → API Keys.

Get the Project URL, which will go to your .env file as NEXT_PUBLIC_SUPABASE_URL

Get your Publishable key, which will go into your .env file as NEXT_PUBLIC_SUPABASE_ANON_KEY

Keep these keys secret and don't share them with anyone.

Step 3) Fill your .env local file with the above keys

Replace your placeholders with:

NEXT_PUBLIC_SUPABASE_URL=https://<your-ref>.supabase.co

NEXT_PUBLIC_SUPABASE_ANON_KEY=<anon or publishable key>

NEXT_PUBLIC_SITE_URL=http://localhost:3000

REVIEW_IP_SALT=<the openssl output>

Step 4) Run the Migration queries on Supabase

SQL Editor → New query. Paste and run each file whole, in order.

[I'm not sharing the queries here because Claude will give you the correct queries based on your project. All you have to do is copy it, add it to supabase and click "Run". If you see "Success. No Rows returned" that's a good sign. If you get any other reply, share it with Claude].

Want to build a website with **Claude Code?**

[Learn LIVE with me](#)

The session is completely free!

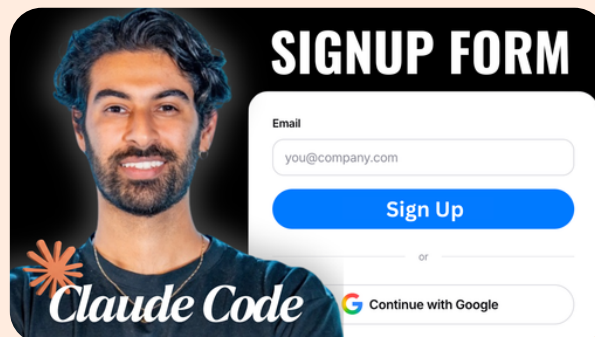

Step 5) Add a "Sign in with Google" button

Follow the exact below steps in order to enable Google as a Sign in option for your App.

1. Supabase → Authentication → Providers → Google. Copy the Callback URL it shows you (<https://<ref>.supabase.co/auth/v1/callback>).
2. Google Cloud Console → APIs & Services → Credentials → Create OAuth client ID → Web application. Paste that callback into Authorized redirect URIs. You'll be asked to configure the consent screen first — External, app name, your email, save.
3. Copy the Client ID and Client Secret back into Supabase's Google provider, enable, save.

Not sure where to start?
